Irregular Crossroad Indicator

MKBH-16RS · MKBH-16YS · MKBH-16RR

MKBH-16RS
MKBH-16YS

MKBH-16RR

Optional light-emitting diod (LED) illumination facets

This indicator's forte is at irregular crossroads (the oppoing roads do not cross at right angles). The facets requiring illumination can be set during installation. (Of a circular arrangement of 8 facets, 4 may be selected for illimination)

Using a red colorized faceplate improves daytime safety (model MKBH-16RR)

Drivers can be warned of the presence of an intersection in the daytime as well. The red colorization of the faceplate was made possible via an original molding technique.

Constant light intensity maintained by an electric double-layer capacitor (EDLC) and charging circuit

Rather than gradually losing brightness white lit, the indicator's light intensity is kept at a constant level using a special built-in charging circuit .

Installation Example
